Travis Bozic Software Engineer

0416 509 772 /travboz travis.bozic@hotmail.com /travis-bozic

After a decade in hospitality, I've learned to read people fast, build trust, stay calm under pressure, and communicate clearly when someone's stressed or confused. That instinct for how people actually experience a system, not just how it's designed to work, is what drew me to software engineering, and now to AI safety. I want to help build and evaluate AI systems with the people affected by them kept firmly in view, combining the technical grounding I've built as a software engineer with the empathy and rapid relationship-building hospitality has given me. I'm particularly interested in how we assess, audit, and govern these systems responsibly as they scale.

Education (and Certifications)

2024 Bachelor of Science (Computer Science) at UNSW
Graduated with Distinction
2024 AWS Cloud Practitioner
2026 MongoDB Associate Developer

Technical Skills

Languages	Golang, Node.js, Bash, Python
Tools	Docker, Podman, Git, GitHub Actions, Terraform
Databases	MongoDB, PostgreSQL, MySQL
Cloud	AWS, DigitalOcean

Projects and Portfolio

Secrets Sharing API (and CLI client) /secrets-sharing-api

- Built a RESTful secrets-sharing API in Go with interface-driven, swappable storage (file-based, extensible to S3/MongoDB), enabling isolated unit testing via mocking
- Designed and implemented a custom HTTP CLI client in Go using the standard library flag package, structuring commands with a subcommand pattern (kubectl/git-style) for improved usability
- Applied common testing practices, including spy-based testing patterns, to validate API behavior across both the server and client components

Cproxy: Caching Proxy Server /cproxy-caching-proxy-server

- Built a caching proxy server in Go with a pluggable, interface-driven cache layer (in-memory and Redis), swappable via config with no code changes, containerised and made 12-factor configurable via environment variables
- Background janitor to clean up in-memory cache, added decorator-based logging cache for expiry sweeping and observability across both backends
- Used middleware and Go's context.Context to propagate cache keys and eligibility decisions through the request lifecycle
- Diagnosed and fixed a silent serialisation bug causing cache-hit panics, replacing it with fail-loud decoding and graceful degradation

Personal Blogging Platform API /personal-blogging-platform-api

- Built a RESTful API in Go for blog article management, backed by MongoDB and containerised via Docker Compose for reproducible local development
- Designed resource-oriented endpoints supporting full CRUD operations, including filtered article listing by tag and publish date
- Streamlined developer workflow with a Makefile (database seeding, container orchestration, server startup) and environment-based configuration

Volunteer Management System (University Capstone Project)

- Developed a full-stack volunteer management system as part of a 5-person team, owning frontend design and implementation in React
- Built features for event scheduling, volunteer assignment, and performance tracking, collaborating cross-functionally via Jira-managed sprints
- Achieved High Distinction (COMP3900)

Work History (non-exhaustive)

All-Rounder/Team Support

Archie Rose Distilling Co. (Sydney, NSW): *August 2024 to current*

- Delivered consistent performance in a fast-paced, high-throughput environment, managing multiple concurrent customer requests while maintaining accuracy and quality under time pressure
- Rapidly acquired and applied specialised product knowledge (craft spirits, cocktail composition) to advise customers, translating technical detail into clear, accessible recommendations
- Consistently met or exceeded sales targets while managing end-to-end bar operations independently, demonstrating ownership and reliability with minimal supervision

Business Banking Associate

Commonwealth Bank Australia (Sydney, NSW): *April 2024 to July 2024*

- Served as primary point of contact for business customers, providing technical support and troubleshooting for banking and merchant service systems
- Diagnosed and resolved customer-reported technical issues under time pressure, adapting quickly to varied and sometimes ambiguous problem scopes
- Built working knowledge of merchant service and payment processing systems to support customer queries, translating technical detail for non-technical users

Senior Bartender/Team Support

Palmer & Co. (Sydney, NSW): *February 2022 to March 2023*

- Progressed from individual contributor to team support role, leading service delivery and mentoring junior staff on procedures and standards
- Ensured full compliance with regulatory (RSA) and health & safety requirements while managing daily operational open/close procedures
- Implemented quality control measures to maintain stock integrity, reducing waste and improving inventory longevity
